

**MULTI-WINDOW BASED GRAPHICAL USER INTERFACE (GUI) FOR WEB  
APPLICATIONS**

[045] It is envisioned that the present invention may be utilized as a system  
5 for transferring data across a network by means of a multi-window based GUI. The  
system comprises a remote server, having at least one window module, .NET  
application, .NET framework, .NET development tools, an HTML beginning tag, an  
HTML ending tag and at least one ASPX tag. The server translates classes and  
10 objects into HTML/DHTML code by taking the tag and embedding code to fit within  
the beginning and ending tag, then transferring the code across an electronic data  
network. The system includes at least one client system coupled to the server.  
The client has a content retrieval module in communication with the server and a  
web browser further comprising at least one window module and interactive menu  
15 module. The interactive menu module reacts to activation and posts back to the  
server through a raised event.

Respectfully submitted,
